

What is CSS clearfix, how is it used, and why is it helpful?

When using the “float” css property to place objects on a page, objects that are floated are outside the normal flow of the page causing things to wrap around it and potentially overflow its container.

Using the clearfix hack helps resolve this issue by setting the overflow, height, and float property. After using clearfix elements will no longer overflow the container.

What is a highlight of what you have learned this week?

A highlight of what I have learned this week is Pseudo Classes in CSS. Specifically the “hover” pseudo class, which I have used in my coding assignment this week. I have a table of 9 images on one of my pages and once hovered on they will show some text that outlines where they were taken.

As well as changing color and background color of links when hovered over.
