What is a highlight of what you have learned this week?

Highlight of what I learned this week is around prop and state in React. How you can use these to simply and dynamically change information in your app.

Considering React, what is one-way, or unidirectional data flow? Why is it important?

In React, one-way data flow means that information is passed down from a parent component to its child components, and changes to the information happen only in the parent component. This helps keep things organized and easier to understand because you know where the data is coming from and where it's going. It also makes it simpler to find and fix problems when something goes wrong. One-way data flow lets you reuse components easily, and it helps make your app faster by optimizing how it updates and shows information. It's like a cool rule that keeps everything running smoothly in React.
